Research highlights

1. The effects of fiscal policy when planning horizons are finite

In a paper recently accepted for publication in the Journal of Money, Credit and Banking, Joep Lustenhouwer and Kostas Mavromatis study the effects of fiscal policy in a New Keynesian model for a closed economy where agents are boundedly rational. They argue that the effects of fiscal policy can change substantially compared to the fully rational case. [Read more.](#)

2. Deposit market concentration and monetary transmission: evidence from the euro area

In a recent DNB working paper, Stephen Kho examines whether banking sector concentration affects how banks transmit monetary policy to deposit rates, using EA country-level data and high-frequency identification. He finds that banks in more concentrated sectors more slowly hike and more quickly cut deposit rates, potentially delaying the transmission to deposit rates by half a year. [Read more.](#)

3. The long-run Phillips curve is ... a curve

Is there a relation between inflation and output in the long run? The answer is no, according to undergraduate macroeconomic textbooks. A recent DNB working paper by Guido Ascari, Paolo Bonomolo and Qazi Haque questions this view showing that, in US data, inflation and output are negatively correlated in the long run: persistently high inflation is associated with sizeable output losses. [Read more.](#)

4. Safe asset scarcity and re-use in the European repo market

Justus Inhoffen and Iman van Lelyveld show in a recent DNB working paper that banks materially increase the rate of re-use in response to tightened asset scarcity induced by the Eurosystem's asset purchase program and accommodate clients' demand for safe assets rather than liquidity and profit

from the repo rate spread. Dealers' re-use of collateral to source liquidity exposes them to collateral runs. [Read more.](#)

5. PhD Defense – interview with Tom Hudepohl

Interview with Tom Hudepohl, until recently economist at the financial markets division of DNB, now seconded to the ECB. On 13 July, Tom defended his PhD thesis titled 'The (side-)effects of unconventional monetary policy in the euro area' at the University of Groningen. [Read more.](#)

6. PhD Defense – interview with Annick van Ool

Annick van Ool defended her PhD dissertation 'Economic Principles in Pension Design' at Maastricht University on September 20. Annick is currently employed as a policy advisor at the financial stability division of DNB. [Read more.](#)

Workshops and conferences

2 – 3 November 2023: [DNB annual research conference](#)

Challenges for monetary policy during normalization

This year's conference will focus on main challenges for the design and implementation of monetary policy in the context of the post-pandemic central bank balance sheet normalisation and rate hikes, taking into account the ongoing evolution of central banks' operational frameworks. In addition, the conference will cover financial stability considerations related to the monetary tightening cycle and possible central bank responses.

Keynote speakers are Klaas Knot (President of DNB), Annette Vissing-Jorgensen (Federal Reserve Board) and Stephen Cecchetti (Brandeis International Business School). We aim to provide a platform for researchers from academia, central banks, and other policy institutions to present and discuss their findings related to these issues.

[program and registration](#)

18-19 December 2023: [2nd XAmsterdam Macroeconomic Workshop](#)

This workshop will consider contributions from all fields of macroeconomics, both theoretical and applied, with particular attention but not exclusive, to the following sub-fields/topics:

- a. Money-macro
- b. Firm Dynamics and Productivity
- c. Expectations and the Macroeconomy
- d. Monetary Policy and Heterogeneity
- e. Labor Markets
- f. Public Finance
- g. (Consumption, Income and Wealth) Inequality
- h. Identification in Macroeconomics

Keynote speakers: Monika Piazzesi (Stanford University) and Martin Schneider (Stanford University)

Other news

Petar Vukmirovic was a keynote speaker at the [Institute for Programming research and Algorithmics \(IPA\) Fall days](#). At that occasion, he also received an award for the best thesis that appeared in his research area in 2022. His thesis was entitled "[Implementation of higher-order superposition](#)".

Research highlights, details

1. The effects of fiscal policy when planning horizons are finite

We show that planning horizons play a crucial role for the value of fiscal multipliers. In particular, when agents have shorter planning horizons, government spending multipliers are smaller, whereas labor income tax multipliers are larger. This implies, for instance, that as horizons shorten, fiscal consolidations based on government spending cuts tend to be less costly. The results are mainly driven by the mistakes of agents' expectations about key variables, like the future real interest rate. Finite horizons give rise to significantly amplified investment responses following fiscal shocks, which are more in line with empirical evidence compared to the muted investment responses implied in models with longer planning horizons but with rule-of-thumb households or in models with heavier discounting like the Blanchard-Yaari New Keynesian model.

See DNB Working Paper 717 [The Effects of Fiscal Policy when Planning Horizons are Finite](#) by Joep Lustenhouwer and Kostas Mavromatis. [Go to the Top](#).

2. Deposit market concentration and monetary transmission: evidence from the euro area

In response to high inflation, policy rates have swiftly increased in the euro area and elsewhere, but banks have raised deposit rates much more slowly. At the same time, deposit rates across euro area countries have somewhat diverged, with banks in some countries hiking rates more quickly than elsewhere. Understanding the sources of this divergence may be helpful to assess the potential need for policy interventions.

3. The Long-Run Phillips Curve is ... a Curve?

We study the empirical relation between inflation and output in the long run, commonly known as the long-run Phillips curve (LRPC). A VAR with stochastic trends provides evidence in favor of a non-linear and negatively sloped LRPC: higher trend inflation is related to lower potential output. In particular, we estimate a threshold level of trend inflation of around 4% below which potential output is independent of trend inflation, and above which every percentage point increase in trend inflation is related to about 1% decrease in potential output per year. This relation is interpreted through the lens of a New Keynesian model generalized to admit time-varying trend inflation and estimated via particle filtering. The LRPC estimated through the structural model is consistent with the one estimated through the VAR. The inference in both models points to a loss in potential output of about 2% per year during the Great inflation period.

4. Safe asset scarcity and re-use in the European repo market

We construct the first measure of collateral re-use at the bank and bond level for the European repo market using the Money Market Statistical Reporting (MMSR) a regulatory transaction dataset. The MMSR is a very rich, transaction-level data set covering most of the European mark money market. Re-use is a widespread practice in the financial wholesale market where dealer banks intermediate government bonds using Securities Financing Transactions (SFTs), e.g., repurchase agreements, security lending transactions, or margin loans. This temporary exchange of cash for collateral assets allows dealers to first source safe assets on the market and subsequently sell them onward to third parties, known as re-use. Our results contribute to the policy debate on trade-offs between shock absorption and financial stability risks of collateral re-use.

5. PhD Defense – interview with Tom Hudepohl

What are your main findings?

I investigated the effects of the Eurosystem's unconventional monetary policy on the behaviour of investors, as well as its side-effects on financial markets. For example, I find that Quantitative Easing contributed to exuberance on European stock markets. Moreover, the purchases by the Eurosystem reduced the amount of bonds that are available to be traded in financial markets. This

contributes to frictions in financial markets, as it becomes more difficult for investors to find specific securities.

The ECB is now tightening its policy – are your findings still relevant?

The findings remain relevant as they inform policymakers about lessons for future policy, in particular since the different monetary policy instruments will remain an integral part the ECB's toolkit going forward (see also the outcome of the ECB's Strategy Review). Additionally, I find that it has become harder to accurately estimate banks' total demand for central bank reserves in the euro area. This is particularly relevant against the background of the ongoing normalization of the Eurosystem's balance sheet, as it could complicate a transition from the current environment with record high levels of excess liquidity towards lower levels of reserves.

[Go to the Top.](#)

6. PhD Defense – interview with Annick van Ool

What is your research about?

Our society is aging, leading to an increase in pension costs. Therefore, pension systems worldwide are being revised to enhance their sustainability, also in the Netherlands. Hybrid pension schemes, such as collective defined contribution (CDC) schemes, are gaining popularity due to a number of attractive features such as limited risks for sponsors, sharing of longevity risk, and lower administrative and investment costs. In my thesis, I have explored four essential economic principles for designing a sustainable pension scheme: fairness, efficiency, insurance, and accountability.

What did you find?

I demonstrate that a CDC scheme does not necessarily comply with the fairness and efficiency principle, but that a CDC scheme can be designed in such a way that it complies with these two principles. I also show that sharing macro-longevity risk between generations in a pension contract as a risk management tool provides welfare benefits and that employees can provide insurance for the macro-longevity risk of retirees. Finally, I investigate the accountability principle by analyzing the sustainable investment policies of Dutch pension funds. I show that signing a sustainable investment initiative increases attention to sustainable investing, but I find no effect on the implementation of sustainable investing.

How did you experience doing a part-time PhD?

It was very interesting to combine my work at DNB with writing a dissertation. All three chapters of my dissertation were inspired by my daily work at the bank. Of course, the combination was also quite challenging at times. Fortunately, DNB has given me the flexibility to regularly work on my dissertation in a focused manner.
